Description

Ingredient

Hemp Extract

Blue Label Proprietary Hemp Extract is an oil extracted right from the hemp plant using the cleanest extraction method, CO2. There are no additives; it's pure CBD hemp oil.

In each harvest, the exact CBD concentration will naturally vary. We guarantee each batch of our Blue Label contains 15~18% CBD, or 150mg~180mg CBD per gram. Scroll up to check out the latest COA, located directly under the pricing. This will give you the exact CBD content.

The Blue Label hemp extract is decarboxylated, which simply means it's been heated to a controlled temperature to activate its phytocannabinoids. In short, this turns the CBDA compounds into CBD. This hemp oil is ideal for those looking to receive a high level of phytonutrients from a non-filtered hemp oil.

Blue Label Specs

The Blue Label hemp extract is a thick and dark paste-like substance. It's non-psychoactive and contains only trace amounts of THC. This hemp extract is legal across the United States and several other countries. No medical card is needed to purchase the Blue Label hemp extract.

- 15 ~ 18% CBD (varies by batch)
- May contain trace CBDa
- Pure CBD hemp oil
- No added ingredients
- Oral syringe
- Ships to all 50 states

When purchasing, choose from 1 gram, 3 grams, or 10 grams. Each size contains a phytocannabinoid concentration of 15-18%. That's 150mg, 450mg, or 1500mg CBD, respectively.

The Blue Label is one of three versions of the proprietary hemp extract. Scroll down to read about each version of this oil to learn which is the best fit for you.

How to Use

{youtube}_1C91E-o_GE|400|320|0{/youtube}

The Blue label hemp extract is packaged in an easy-to-use oral syringe. Simply dispense the oil on your finger or a spoon and place it under your tongue. Allow the oil to absorb into your body by keeping the oil under your tongue for 60-90 seconds, and then swallow whatever is left over.

Serving Size

This product is a thick, paste-like substance, which makes measuring the servings a little unique. The recommended serving size is the size of a grain of rice (as pictured on the left) once or twice daily. That can be safely increased or decreased as needed. Each rice-sized piece has approximately 4mg-5mg proprietary cannabinoid blend. The only negative side effect reported to us is stomach discomfort when excessively large amounts are consumed, which is common with oil-based products. Below is an overview of the phytocannabinoid potency in each size of our Blue Label hemp oil concentrate. 1 gram / 150mg-180mg CBD / 30 servings 3 grams / 450mg-540mg CBD / 90 servings 10 grams / 1500mg-1800mg CBD / 300 servings

Phytocannabinoids and Our Endocannabinoid System

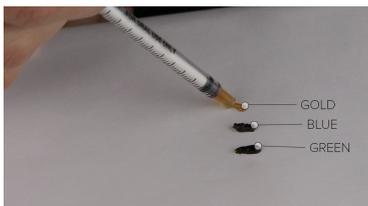

When phytocannabinoids enter the body, they interact with receptors located in the brain, nervous system, and immune system. These receptors collectively make up what's known as the endocannabinoid system. Nearly all animals have an endocannabinoid system and it is believed to support many of our biological processes. Phytocannabinoids work positively with this system to help maintain the homeostasis of our body.

High-Quality Hemp Oil

Proprietary Hemp Extract is manufactured under very strict quality controls in a professional laboratory that follows

GMP standards. Each batch is lab tested by an unbiased third-party lab using high-tech liquid gas chromatography for accurate results. These tests verify the product's cannabinoid profile. Occasional blind-tests are also sent to a separate third-party lab to make sure results are consistent and accurate.

The Three Versions of Hemp Extract

There are three versions of Proprietary Hemp Extract (PHE) available, each with noticeable differences that should be considered.

Raw Label

Let's start with the Raw (also called the "Green") version. As its name suggests, this is the first raw version of the oil. It is extracted from the plant and packaged; no heating or filtering is applied. The Raw version is a full-spectrum, whole plant oil with the composition nature intended it to have. You'll find a multitude of cannabinoids and terpenes in the Raw version. It's dark in color and has a paste-like consistency.

Blue Label

The Blue version is made by taking the Raw version and heating it up to a controlled temperature. This process (called decarboxylation) is a common practice for "activating" all of the phytocannabinoids. For those looking to get the most phytonutrients possible without filtering the oil, the Blue version is ideal. The Blue hemp oil is a thick paste and is very dark in color. (Please note: the consistency may vary by batch, so be careful when dispensing for the first time.)

Gold Label

Finally, we have the Gold version. We've taken the pure extract of the plant to create the Raw, then heated it up to create the Blue and now the oil is filtered to create the Gold. The filtering process removes some of the extra plant parts, which changes the oil's color to a light orange and the consistency to a gel. This version is for those looking for the highest phytocannabinoid concentration available, with little interest in the other components of the plant.
